## The Peanut Butter & Jelly Computer

A typical computer is made out of hardware components that store and display information, and software that tells the hardware *how* to store and display information. The hardware and software interact to create a functional computer.

The peanut butter & jelly computer makes PB&J sandwiches. Its hardware components are the “agents” that actually make the PB&J sandwich. Its software components are responsible for giving the hardware components *instructions* on *how* to make the PB&J sandwich.

### Part 1: Hardware

In the space below, make a list of all the hardware components in the PB&J computer.

Name(s): \_\_\_\_\_

**Part 2: Software**

Create a set of instructions for the hardware components of the PB&J computer.
